Support Engineer and Certified Trainer

# HOW ARE PROBLEMS DETECTED ON ZABBIX?

---

Zabbix is constantly collecting metrics from Hosts

- ⚡ The values are collected by items (where most of them consider an update interval between collections)
- ⚡ Any collected value can be evaluated against a logical expression that will inform you if there is a problem
- ⚡ These expressions are known as Triggers
  - ✓ If the Trigger expression is TRUE = **PROBLEM**
  - ✓ If the Trigger expression is FALSE = **OK**

Memory utilization > 90%

# TRIGGERS IN MORE DETAILS

---

How does a trigger expression looks like?

⚡ Syntax:

**function(/host/key,<additional parameters>)<operator><constant>**

- ✓ **function**: allow to calculate the collected values (average, minimum, maximum, sum), find strings, reference current time and other factors. Depending on the Function, it will require some **additional parameters**.
- ✓ **host** and **key must exist** in Zabbix.
- ✓ An **<operator>** will be used to compare the result of the function with the **constant**.
- ✓ **constant** is the expected threshold/reference to define the expression state.

**avg(/Production server/vm.memory.utilization[pused],5m)>90**

# TRIGGERS IN MORE DETAILS

## Functions: the magic behind the triggers

 Available functions on Zabbix:

Function group	Functions
<a href="#">Aggregate functions</a>	<b>avg</b> , bucket_percentile, count, histogram_quantile, item_count, kurtosis, mad, <b>max</b> , <b>min</b> , skewness, stddevpop, stddevsamp, sum, sumofsquares, varpop, varsamp
<a href="#">Foreach functions</a>	avg_foreach, bucket_rate_foreach, count_foreach, exists_foreach, last_foreach, max_foreach, min_foreach, sum_foreach
<a href="#">Bitwise functions</a>	bitand, bitlshift, bitnot, bitor, bitrshift, bitxor
<a href="#">Date and time functions</a>	date, dayofmonth, dayofweek, now, time
<a href="#">History functions</a>	change, changecount, count, countunique, find, first, fuzzytime, <b>last</b> , logeventid, logseverity, logsource, monodec, monoinc, <b>nodata</b> , percentile, rate
<a href="#">Trend functions</a>	<b>baselinedev</b> , <b>baselinewma</b> , <b>trendavg</b> , <b>trendcount</b> , <b>trendmax</b> , <b>trendmin</b> , <b>trendstl</b> , <b>trendsum</b>
<a href="#">Mathematical functions</a>	abs, acos, asin, atan, atan2, avg, cbrt, ceil, cos, cosh, cot, degrees, e, exp, expm1, floor, log, log10, max, min, mod, pi, power, radians, rand, round, signum, sin, sinh, sqrt, sum, tan, truncate
<a href="#">Operator functions</a>	between, in
<a href="#">Prediction functions</a>	forecast, timeleft
<a href="#">String functions</a>	ascii, bitlength, bytelength, char, concat, insert, left, length, ltrim, mid, repeat, replace, right, rtrim, trim

# COMMON MISTAKES AND RECOMMENDATIONS

---

## Flapping:

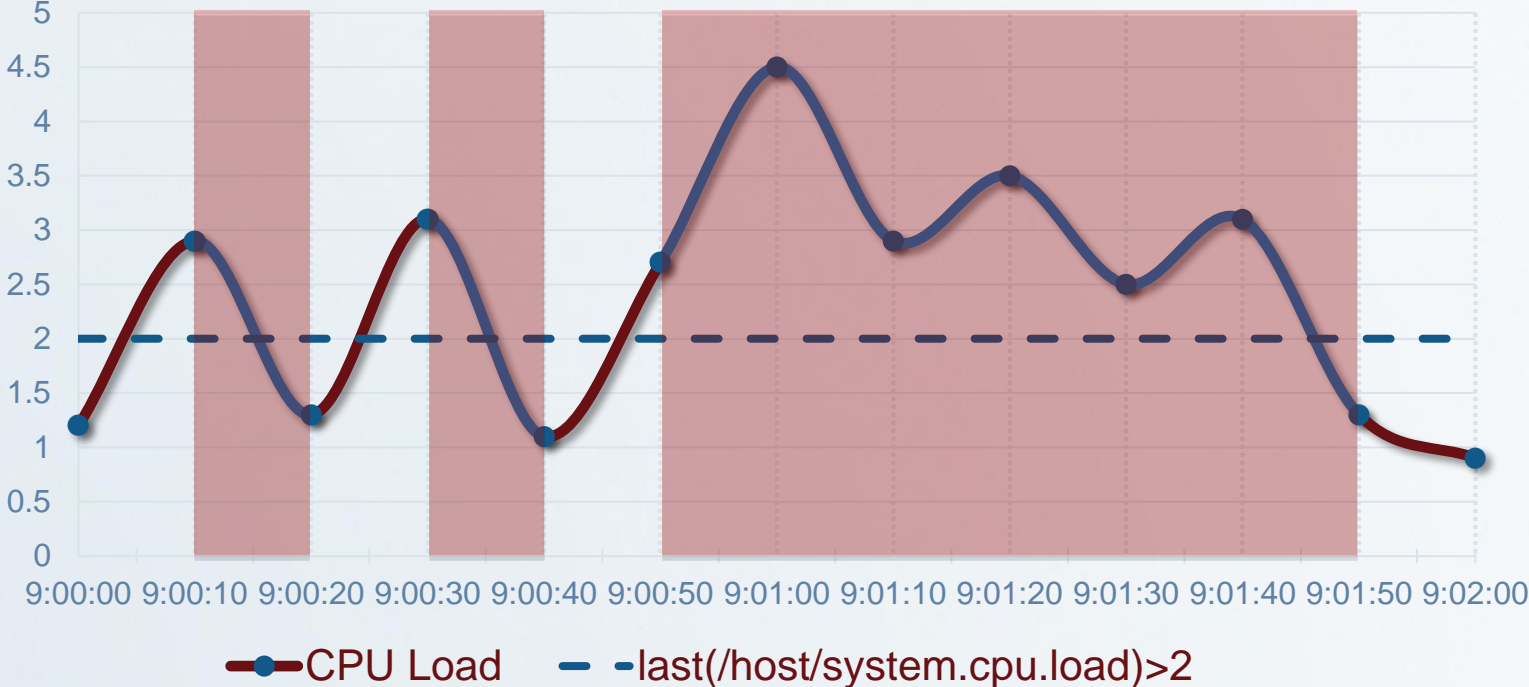

⚡ Really sensitive triggers can cause flapping

# COMMON MISTAKES AND RECOMMENDATIONS

## Flapping:

⚡ Really sensitive triggers can cause flapping

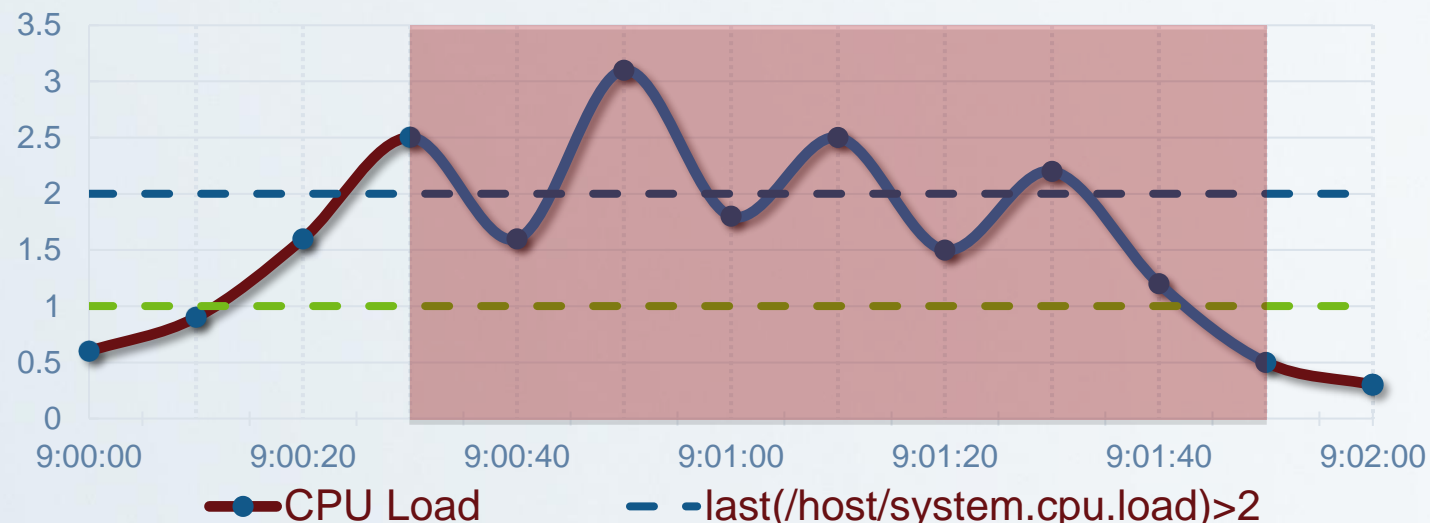

# COMMON MISTAKES AND RECOMMENDATIONS

## The `last()` function

- ⚡ Can be really sensitive and lead to flapping
- ⚡ Recommended the use of **Recovery Expressions**
  - ✓ Once a problem is detected, a different expression is used for recovery
  - ✓ When using a Recovery expression, the problem will recover if:

The trigger expression = **FALSE** and The recovery expression = **TRUE**

# COMMON MISTAKES AND RECOMMENDATIONS

---

## Additional note on the `last()` function

- ⚡ Time period is not supported
- ⚡ Using the `#` symbol will denote the Nth previous value

<code>last(/host/key,#1)</code>		Last value
<code>last(/host/key,#3)</code>		3rd previous value

`last(/host/key,#3)` and `last(/host/key,#2)` and `last(/host/key)`

# COMMON MISTAKES AND RECOMMENDATIONS

## The `min()` function

⚡ Lowest value of an item within the defined evaluation period

# COMMON MISTAKES AND RECOMMENDATIONS

## The `max()` function

⚡ Highest value of an item within the defined evaluation period.

# ALERT WHEN THERE IS **NO DATA** BEING COLLECTED BY AN ITEM

## The `nodata()` function

✓ Syntax:

`nodata(/host/key,time period,<mode>)`

✓ Time can't be defined as less than 30 seconds

✓ Returns 1 – if no data received during the defined period of time

✓ Returns 0 – otherwise

# ALERT WHEN THERE IS **NO DATA** BEING COLLECTED BY AN ITEM

---

## Notes on **nodata()** function

### ⚡ **nodata()** x proxy:

- ✓ The **nodata()** triggers monitored by proxies are, by default, **sensitive to the proxy availability**
- ✓ They will not fire if the data is expected from a proxy which is currently offline
- ✓ You can make use of the “strict” mode to ignore the proxy availability

### ⚡ **nodata()** can return some **false positives** if:

- ✓ There's **time sync** issues between Zabbix server, proxy, and agent
- ✓ The **discard unchanged** preprocessing steps are used
- ✓ **History is not saved** for the item

# LONG PERIOD DATA EVALUATION

---

## Let's talk a little about Cache usage

### ⚡ Value cache

- ✓ Value Cache stores values needed for trigger calculations and calculated items
- ✓ Used to access historical data, instead of making direct SQL calls to the database
- ✓ Is controlled by the **ValueCacheSize** (0, 128K-64G) parameter in Zabbix server configuration file
- ✓ Example:

Function last(#10) keeps 9 latest values in value cache

Function avg(1h) keeps 1 hour of data in value cache

- ⚡ Only if some value is missing in the cache, the history syncer will read it from the Database and insert into the cache.

# LONG PERIOD DATA EVALUATION

---

Sometimes we want to evaluate the behavior of our systems considering months, even years.

- ⚡ Using the already mentioned functions is **not ideal for the job**
- ⚡ There's a specific set of functions designed for this called **Trend functions**
  - ✓ `trendfunction(period,period_shift)`
  - ✓ `period` - the time period (**minimum** '1h'), defined as `<N><time unit>`:
    - N - number of time units
    - time unit - **h** (hour), **d** (day), **w** (week), **M** (month) or **y** (year)
  - ✓ `period_shift` - the absolute time period

# LONG PERIOD DATA EVALUATION

---

Some examples for Trend Functions:

`trendavg(/host/key,1h:now/h)` - #the average for the previous hour (e.g. 12:00-13:00)

`trendcount(/host/key,1h:now/h-1h)` - #the value count for two hours ago (11:00-12:00)

`trendsum(/host/key,1h:now/h-2h)` - #the sum for three hours ago (10:00-11:00)

`trendmax(/host/key,1M:now/M-1y)` - #the maximum for the previous month a year ago

`trendmin(/host/key,1M:now/M-1y)` - #the minimum for the previous month a year ago

# LONG PERIOD DATA EVALUATION

---

## Notes on the Trend Function Cache

- In contrast to history functions, they use **trend data** for calculation
- Trends store hourly aggregate values. Trend functions use these hourly averages, and thus are **useful for long-term analysis**
- Trend function results are cached so multiple calls to the same function with the same parameters fetch info from the database only once.
- The trend function cache is controlled by the **TrendFunctionCacheSize** (128K-2G) server parameter.

The ZABBIX logo consists of the word "ZABBIX" in a bold, white, sans-serif font, centered within a solid red rectangular box. The background of the entire slide is a dark blue gradient with a faint, glowing network of white lines and dots, and a semi-transparent world map in the center-right.
