

# **How to extend Zabbix**

**Takanori Suzuki**

# Introduction

- Takanori Suzuki (irc: tsuzuki)
  - Member of Zabbix-JP, Zabbix community in Japan.
  - Working at MIRACLE LINUX corporation.
  - Making some Zabbix patches and extensions.
    - Non-stop, dynamically reloading “DebugLevel” and “LogSlowQueries”
    - Multiple Zabbix active agent monitoring support
    - Windows Eventing 6.0 support in Win2008

# **There are several ways to extend...**

- Using Zabbix API
- Using Zabbix Protocol (get and sender)
- Changing Zabbix Server code
- Changing Zabbix Agent code

# Using Zabbix API

- It's well known, so I skip the explanation.
- Zabbix API Reference
  - URL:<http://www.zabbix.com/documentation/2.0/manual/appendix/api/api>
- Functions
  - Get, create, delete, update are supported on hosts, items, triggers, actions and many other objects.

# **Using Zabbix Protocol (get, sender and agent active)**

- If we want to send or get data to Zabbix, we can use Zabbix protocols.
  - Zabbix get protocol
  - Zabbix Sender protocol
  - Zabbix Agent (Active) protocol

# Zabbix get protocol

- Just sending key character data to 10050 port

```
$ telnet 127.0.0.1 10050
Trying 127.0.0.1...
Connected to localhost (127.0.0.1).
Escape character is '^].
agent.version
ZBXD2.0.1Connection closed by foreign host.
```

each square is 1Byte

a g e n t . v e r s i o n

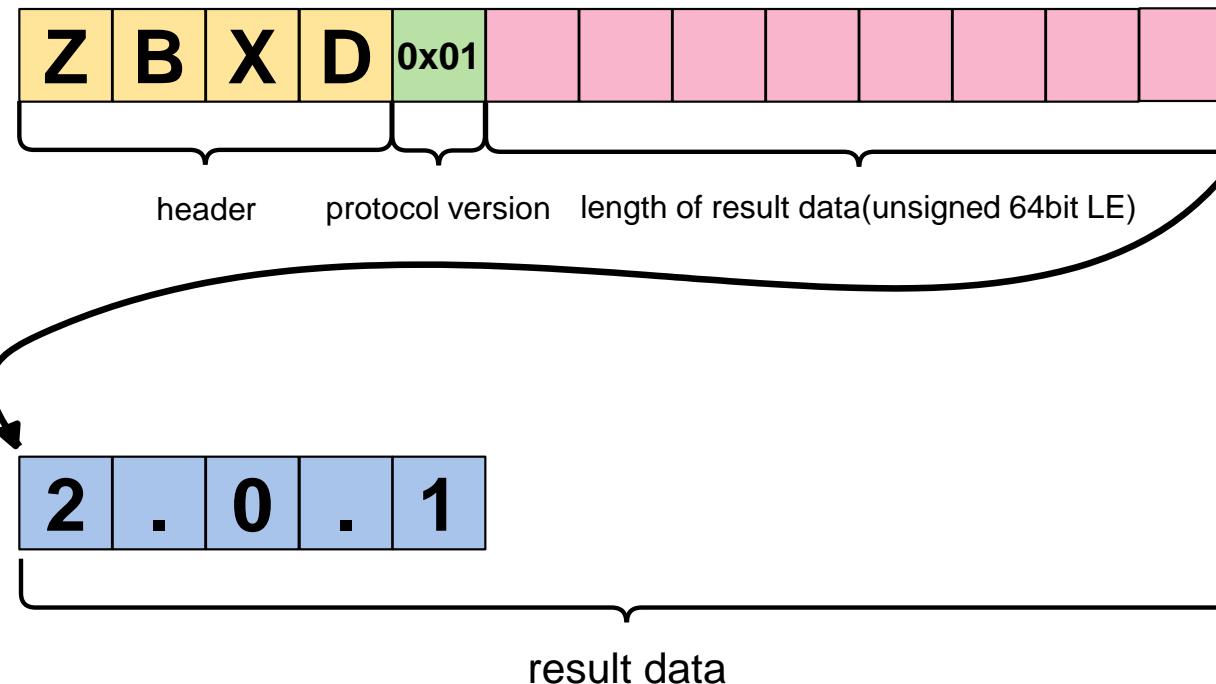

key data

# Zabbix get protocol

- Data is returned with header “ZBXD\1” and the following data length.

each square is 1Byte

# Zabbix get protocol library

- I made Zabbix get protocol class to Python library "zbxpy".

<https://github.com/BlueSkyDetector/zbxpy>

```
>>> import zbxpy
>>> zbx_get = zbxpy.ZabbixGet(u'127.0.0.1')
>>> zbx_get.request_key = "agent.version"
>>> print zbx_get.get()
2.0.1
```

# Zabbix get protocol example

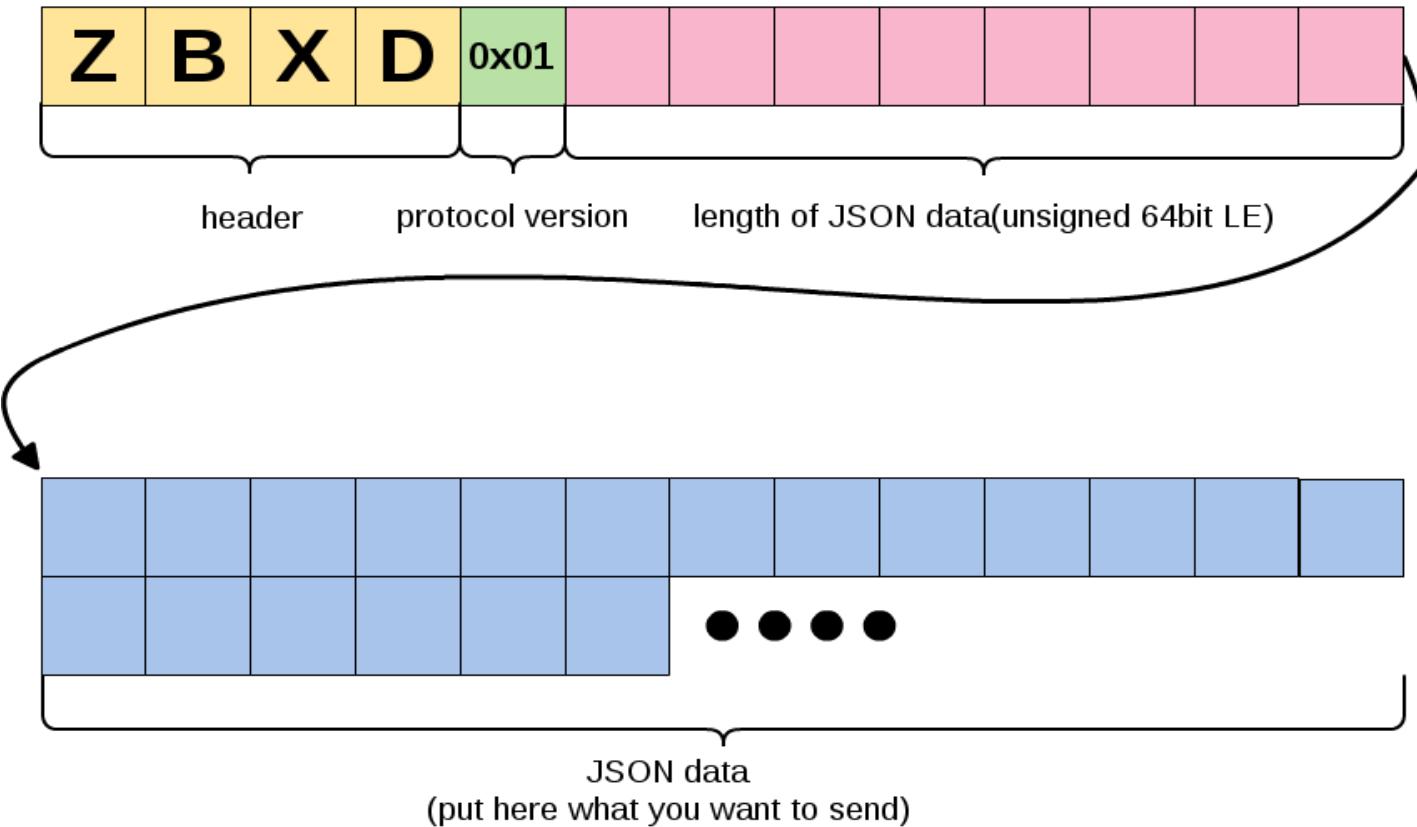

- Demo
  - By zbxpy, Python program can get data directly from Zabbix Agent.

# Zabbix sender and active agent protocol

- data format is JSON with header.

each square is 1Byte

# Zabbix sender and active agent protocol

- JSON data format (send data)

```
{  
  "data":  
  [  
    {  
      "host": "HostA",  
      "value": "sent data",  
      "key": "AppX_Logger"  
    }  
  ],  
  "request": "sender data"      <--- or "agent data"  
}
```

# Zabbix sender and active agent protocol

- JSON data format (receive data)

```
{  
    "response": "success",  
    "info": "Processed 2 Failed 0 Total 2 Seconds spent  
0.000103"  
}
```

# Zabbix sender and active agent protocol library

- I made Zabbix sender protocol class to Python library "zbxpy".

<https://github.com/BlueSkyDetector/zbxpy>

```
>>> import zbxpy
>>> sender = zbxpy.ZabbixSender(u'127.0.0.1')
>>> for num in range(0, 2):
...     sender.add_data(u'HostA', u'AppX_Logger', u'sent
data ' + str(num))
...
>>> res = sender.send()
>>> print sender.send_data
ZBXD◆{"data": [{"host": "HostA", "value": "sent data 0", "key": "AppX_Logger"}, {"host": "HostA", "value": "sent data 1", "key": "AppX_Logger"}], "request": "sender data"}
>>> print res
ZBXDW{
    "response": "success",
    "info": "Processed 2 Failed 0 Total 2 Seconds spent 0.034930"}
```

# Zabbix sender and active agent protocol example

- Demo
  - By zbxpy, Python program can send data directly from the program to Zabbix Server.

# **Extend in Zabbix Server side**

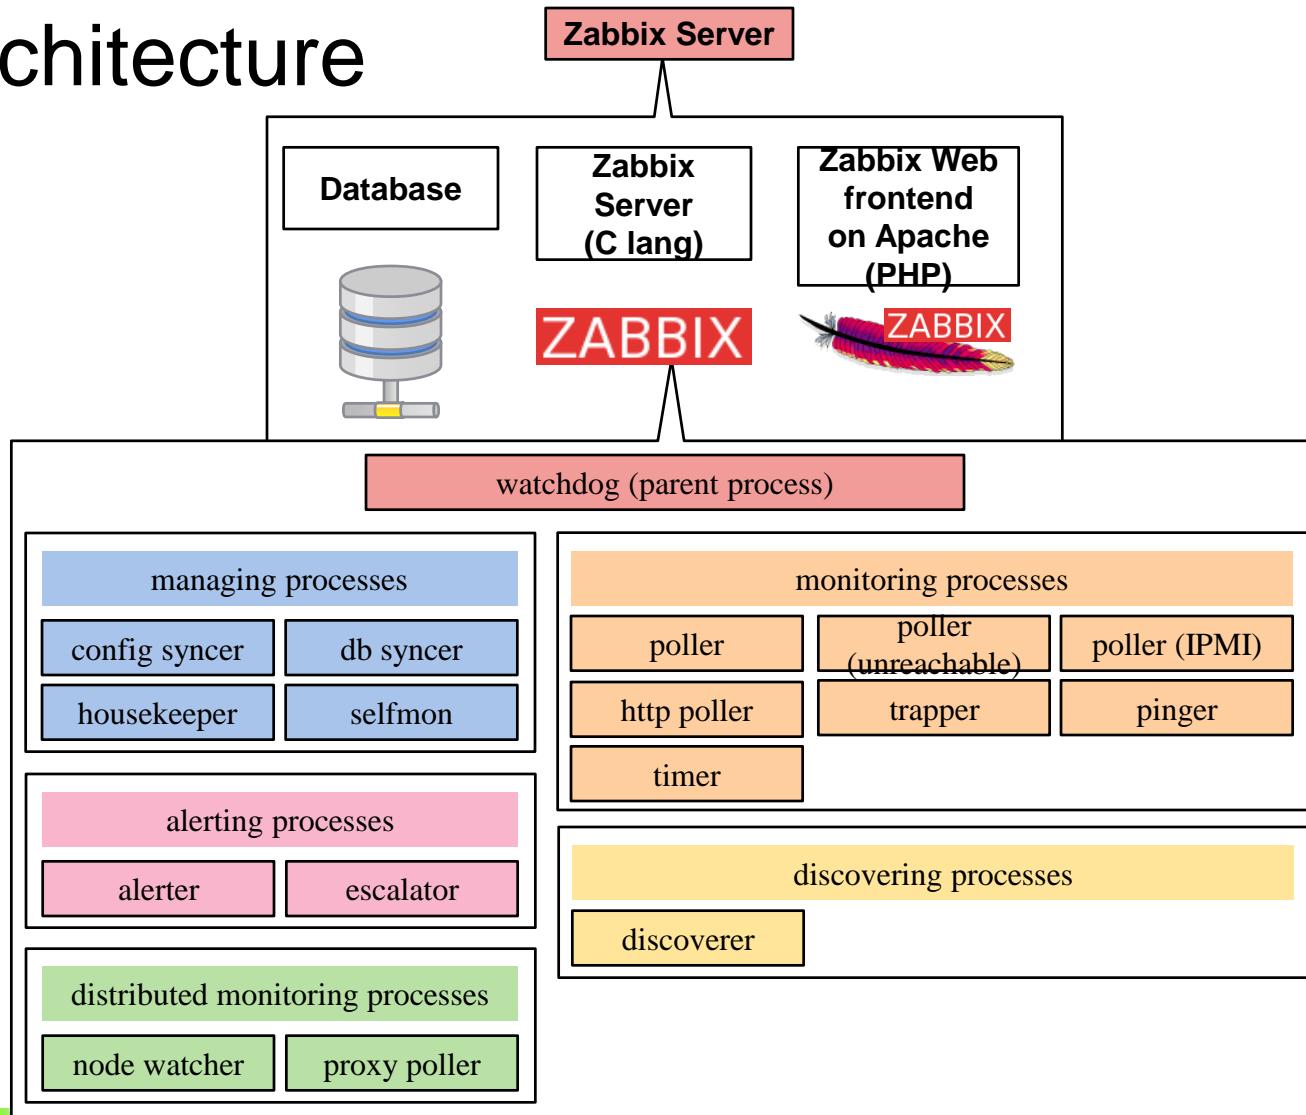

- Zabbix Server consists from some kind of processes.
- We can add new features by adding new code to each process code.

# Extend in Zabbix Server side

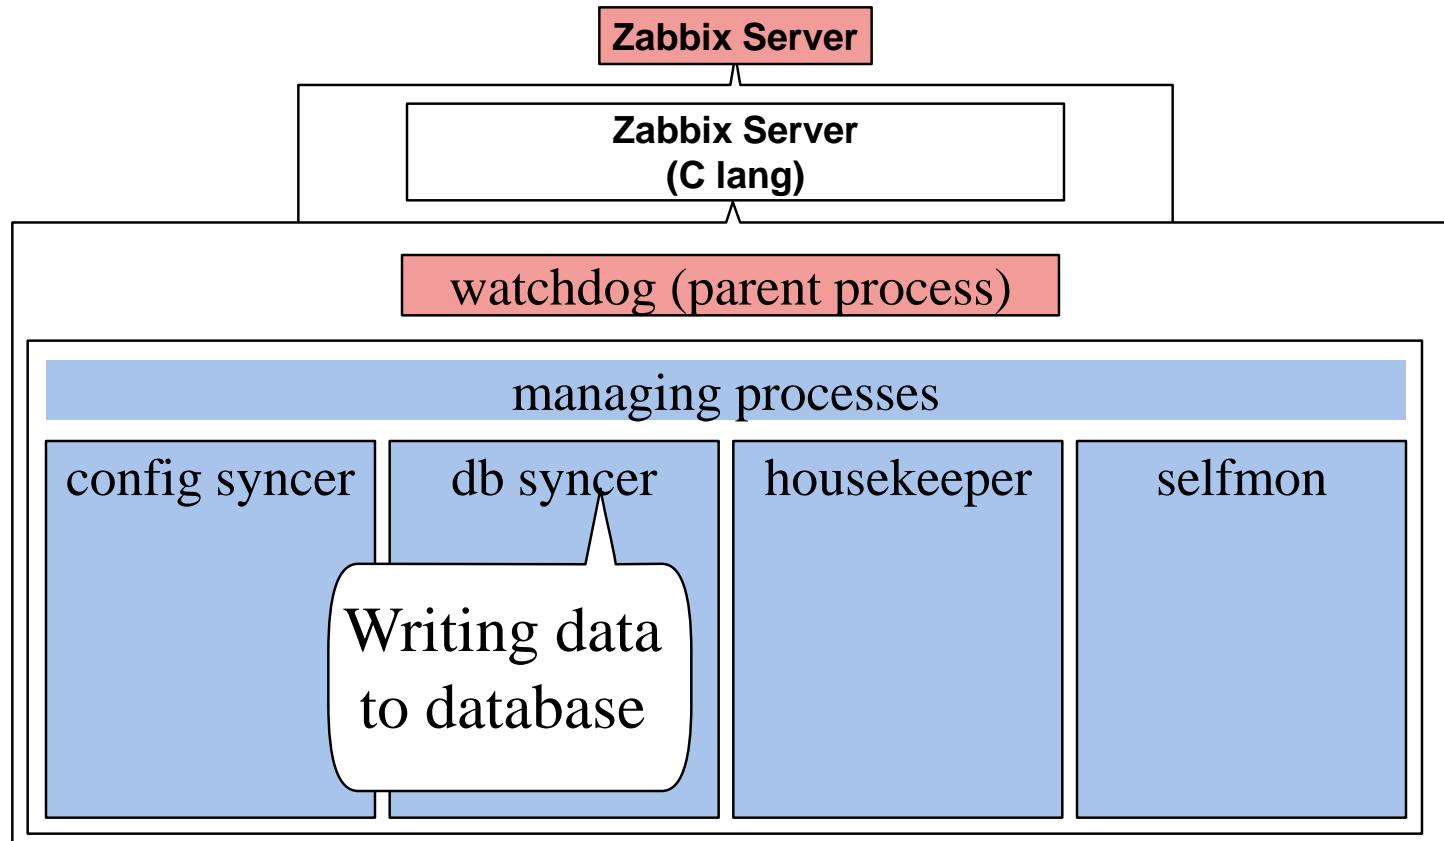

## Architecture

# Extend in Zabbix Server side

For example, "db syncer" process stores history data to database.

# Extending Zabbix Server example

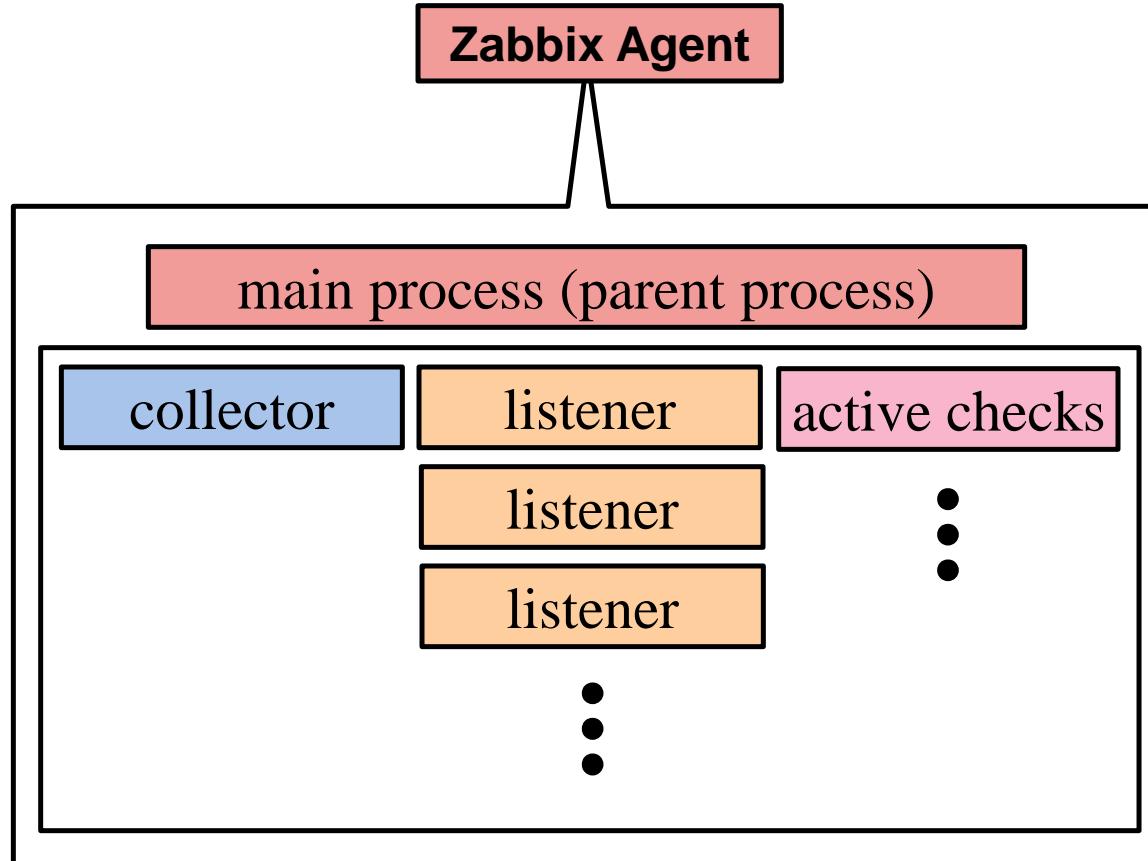

- By changing "db syncer" code, we can store the history data to other things, like NoSQL.

# Extend in Zabbix Agent side

## Architecture

# Extending Zabbix Agent example

- I made a PoC patch, which adds multiple "active checks" process to Zabbix Agent to support multiple server in Active Checks.

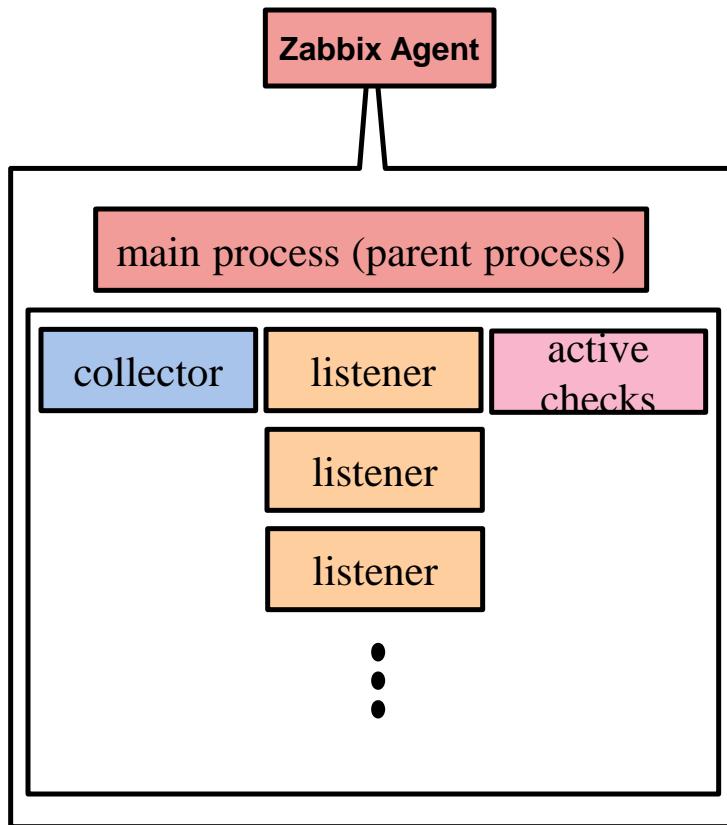

<https://support.zabbix.com/browse/ZBXNEXT-584>

- It's already merged after Zabbix 1.8.12 and 2.0RC3.
